Exercises

#### Taste of plotting

### What is R?

#### R is a statistical computing environment

- Many many common statistical tools baked in
- Easy data manipulation
- Robust add-on community http://cran.r-project.org/web/packages/
- Extensive plotting capabilities
- ► Free and open source! http://www.r-project.org/

► Support for all the basic operators

Support for all the basic operators

[1] 4

> 4 \* 8

[1] 32

> 20/3

[1] 6.7

Support for all the basic operators

[1] 4

> 4 \* 8

[1] 32

> 20/3

[1] 6.7

► And more

Support for all the basic operators

- [1] 4
- > 4 \* 8
- [1] 32
- > 20/3
- [1] 6.7
- ► And more
  - > 5\*\*2
  - [1] 25
  - > sqrt(625)
  - [1] 25
  - > log(10)
  - [1] 2.3

▶ We can store the results of any expression in a variable

▶ We can store the results of any expression in a variable

$$> a = 2 + 2$$

▶ We can store the results of any expression in a variable

$$> a = 2 + 2$$

▶ And we can display the contents of a variable

> a

[1] 4

▶ We can store the results of any expression in a variable

$$> a = 2 + 2$$

- ▶ And we can display the contents of a variable
  - > a
  - Γ1 4
- ▶ Not as common anymore, but <- can be used instead of =
  - > a <- 2 + 2

▶ R thinks about data differently. In R, almost everything is a vector.

- ▶ R thinks about data differently. In R, almost everything is a vector.
- Lets look at 'a' again

- ▶ R thinks about data differently. In R, almost everything is a vector.
- Lets look at 'a' again
  - > a
  - [1] 4

- R thinks about data differently. In R, almost everything is a vector.
- Lets look at 'a' again
  - > a
  - Γ1 4
- ▶ Notice the [1], R treats scalars as one dimensional vectors

▶ We can create vectors using the c(...) function

▶ We can create vectors using the c(...) function

```
> a = c(1, 2, 3)
> b = c(4, 5, 6)
> a
[1] 1 2 3
> b
[1] 4 5 6
```

▶ We can create vectors using the c(...) function

> 
$$a = c(1, 2, 3)$$
  
>  $b = c(4, 5, 6)$   
>  $a$   
[1] 1 2 3  
>  $b$ 

► And since R thinks of everything as vectors we can do some very intuitive things with them

▶ We can create vectors using the c(...) function

> 
$$a = c(1, 2, 3)$$
  
>  $b = c(4, 5, 6)$   
>  $a$   
[1] 1 2 3  
>  $b$ 

► And since R thinks of everything as vectors we can do some very intuitive things with them

▶ We can access the elements of a vector

▶ We can access the elements of a vector

```
> a[2]
[1] 2
```

We can access the elements of a vector

```
> a[2]
[1] 2
> a[1] + a[2] + a[3]
[1] 6
```

We can access the elements of a vector

```
> a[2]
[1] 2
> a[1] + a[2] + a[3]
[1] 6
```

▶ Note R vector indices start at 1 not 0

We can access the elements of a vector

```
> a[2]
[1] 2
> a[1] + a[2] + a[3]
[1] 6
```

- Note R vector indices start at 1 not 0
- ▶ We can also create ranges of values

We can access the elements of a vector

```
> a[2]
[1] 2
> a[1] + a[2] + a[3]
[1] 6
```

- Note R vector indices start at 1 not 0
- We can also create ranges of values

We can access the elements of a vector

```
> a[2]
[1] 2
> a[1] + a[2] + a[3]
[1] 6
```

- Note R vector indices start at 1 not 0
- We can also create ranges of values
  - > 1:10

And more complex sequences

We can access the elements of a vector

```
> a[2]
[1] 2
> a[1] + a[2] + a[3]
[1] 6
```

- Note R vector indices start at 1 not 0
- ▶ We can also create ranges of values
  - > 1:10

And more complex sequences

▶ Since R is vector based we can pass vectors to functions

- ▶ Since R is vector based we can pass vectors to functions
  - > a
  - [1] 1 2 3
  - > b
  - [1] 4 5 6

▶ Since R is vector based we can pass vectors to functions

```
> a
```

[1] 1 2 3

> b

[1] 4 5 6

> length(a)

[1] 3

Since R is vector based we can pass vectors to functions

```
> a
[1] 1 2 3
```

> b

[1] 4 5 6

> length(a)

[1] 3

> sqrt(b)

[1] 2.0 2.2 2.4

Since R is vector based we can pass vectors to functions

```
> a
[1] 1 2 3
> b
[1] 4 5 6
> length(a)
[1] 3
> sqrt(b)
[1] 2.0 2.2 2.4
> sum(a)
[1] 6
```

Since R is vector based we can pass vectors to functions

```
> a
[1] 1 2 3
> b
[1] 4 5 6
> length(a)
[1] 3
> sqrt(b)
[1] 2.0 2.2 2.4
> sum(a)
[1] 6
> mean(a + b)
[1] 7
```

#### **Exercises**

- Create a vector containing 4 numbers
- ► Compute the mean by directly adding the numbers
- ► Compute the mean with the mean(...) function

### **Exercises**

► Create a vector containing 4 numbers

### **Exercises**

- Create a vector containing 4 numbers
  - > my.numbers = c(2/3, 1.1, 5, 22)

- Create a vector containing 4 numbers
  - > my.numbers = c(2/3, 1.1, 5, 22)
- Compute the mean by directly adding the numbers

- Create a vector containing 4 numbers
  - > my.numbers = c(2/3, 1.1, 5, 22)
- ► Compute the mean by directly adding the numbers
  - > (my.numbers[1] + my.numbers[2] +
  - + my.numbers[3] + my.numbers[4]) / 4
  - [1] 7.2

- Create a vector containing 4 numbers
  - > my.numbers = c(2/3, 1.1, 5, 22)
- Compute the mean by directly adding the numbers
  - > (my.numbers[1] + my.numbers[2] +
  - + my.numbers[3] + my.numbers[4]) / 4
  - [1] 7.2
- ► Compute the mean with the mean(...) function

- Create a vector containing 4 numbers
  - > my.numbers = c(2/3, 1.1, 5, 22)
- ► Compute the mean by directly adding the numbers
  - > (my.numbers[1] + my.numbers[2] +
  - + my.numbers[3] + my.numbers[4]) / 4

[1] 7.2

- ► Compute the mean with the mean(...) function
  - > mean(my.numbers)
  - [1] 7.2

R can do a whole lot!

Always remember: tab completion

- Always remember: tab completion
  - Works with variable names
  - Works with column names (more on that in a minute)
  - Works with function names AND arguments

- Always remember: tab completion
  - Works with variable names
  - Works with column names (more on that in a minute)
  - Works with function names AND arguments
- ▶ The ? operator will tell you what functions do

- Always remember: tab completion
  - Works with variable names
  - Works with column names (more on that in a minute)
  - Works with function names AND arguments
- ▶ The ? operator will tell you what functions do
  - > ?sqrt
  - > ?"+"

- Always remember: tab completion
  - Works with variable names
  - Works with column names (more on that in a minute)
  - Works with function names AND arguments
- ► The ? operator will tell you what functions do
  - > ?sqrt
  - > ?"+"
- The ?? operator will search the help for a keyword
  - > ??binomial

- Always remember: tab completion
  - Works with variable names
  - Works with column names (more on that in a minute)
  - Works with function names AND arguments
- ▶ The ? operator will tell you what functions do
  - > ?sqrt
  - > ?"+"
- ▶ The ?? operator will search the help for a keyword
  - > ??binomial
- More on the web!
  - http://cran.r-project.org/manuals.html
  - http://cran.r-project.org/doc/FAQ/R-FAQ.html

## Loading Data

- ▶ Loading data in R uses the read.\* family of functions
  - ► read.csv(...) for comma separated value files
  - ▶ read.table(...) for tab delimited files
- ▶ The read functions can read from a local file and the web
- When working with local files always be aware of your current directory

```
> getwd()
```

[1] "/export/home/fishjord/documents/ged\_lab/SROP/R\_intro"

http://fishjord.github.io/resources/weather\_year.csv > data = read.csv("http://fishjord.github.io/resources/weather\_year.csv", header=T)

### Data details

- ▶ head(...) will show us the first few rows
  - > head(data)

	temp	humidity	pressure	wind.speed	precipitation
1	40	50	30	6	0e+00
2	49	53	30	7	1e-07
3	62	76	30	14	3e-02
4	63	66	30	5	0e+00
5	62	68	30	6	0e+00
6	69	69	30	10	4e-02

- where tail(...) does the opposite
  - > tail(data)

	temp	humidity	pressure	wind.speed	precipitation
361	35	80	30	10	2.6e-01
362	31	85	30	9	4.0e-02
363	32	71	30	2	0.0e+00
364	35	65	30	3	0.0e+00
365	45	57	30	10	1.0e-07
366	52	48	30	8	0.0e+00

- ▶ length(...) will tell us the length of something
  - > length(data)
  - [1] 5

```
▶ length(...) will tell us the length of something
```

```
> length(data)
```

dim(...) will tell us the dimensions of the object

```
> dim(data)
```

- ▶ class(...) will tell us what kind of object we have
  - > class(data)
  - [1] "data.frame"

- class(...) will tell us what kind of object we have
  - > class(data)
  - [1] "data.frame"
- DataFrames are the primary way to interact with data in R
- Can think of them as matrices

#### Data details

str(...) will tell us about the structure of the object

#### Data details

### summary(...) will give a summary of the object

> summary(data)

```
temp humidity pressure
Min. :11.0 Min. :37.0
                         Min. :29.4
